

Amendments to the Claims

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of claims:

1. (Currently Amended) A method of authenticating a pair of correspondents A,B to permit exchange of information therebetween, each of said correspondents having a respective private key a, b and a public key p_A, p_B derived from a generator α and respective ones of said private keys a, b , said method including the steps of
 - i) a first of said correspondents A selecting a first random integer x and exponentiating a function $f(\alpha)$ including said generator to a power $[[g^{(x)}]] g(x)$ to provide a first exponentiated function $f(\alpha)^{g(x)}$;
 - ii) said first correspondent A forwarding to a second correspondent B a message including said first exponentiated function $f(\alpha)^{g(x)}$;
 - iii) said correspondent B selecting a second random integer y and exponentiating a function $f(\alpha)$ including said generator to a power $[[g^{(y)}]] g(y)$ to provide a second exponentiated function $f(\alpha)^{g(y)}$;
 - iv) said second correspondent B constructing a session key K from information made public by said first correspondent A and information that is private to said second correspondent B, said session key K also being constructible by said first correspondent A ~~for~~ from information made public by B and information that is private to said first correspondent A;
 - v) said second correspondent B generating a value h of a function $F[\delta, K]$ where $F[\delta, K]$ denotes a cryptographic function applied conjointly to δ and K and where δ is a subset of the public information provided by B thereby to bind the values of δ and K ;
 - vi) ~~said second of said correspondents~~ correspondent B forwarding a message to said first correspondent A including said second exponential function $f(\alpha)^{g(y)}$ and said value h of said cryptographic function $F[\delta, K]$;
 - vii) said first correspondent receiving said message and computing a session key K' from information made public by said second correspondent B and private to said

first correspondent A;

viii) said first correspondent A computing a value h' of a cryptographic function $F[\delta, K']$; and

ix) comparing said values obtained from said cryptographic functions F to confirm their correspondence.

2. (Original) A method of claim 1 wherein said message forwarded by said first correspondent includes an identification of the first correspondent.

3. (Original) A method according to claim 1 wherein said message forwarded by said second correspondent includes an identification of said second correspondent.

4. (Original) A method according to claim 3 wherein said message forwarded by said first correspondent includes an identification of the first correspondent.

5. (Original) A method according to claim 1 wherein said first function $f(\alpha)$ including said generator is said generator itself.

6. (Original) A method according to claim 1 wherein said second function $f(\alpha)$ including said generator is said generator itself.

7. (Original) A method according to claim 6 wherein said first function $f(\alpha)$ including said generator is said generator itself.

8. (Original) A method according to claim 1 wherein said first function including said generator $f(\alpha)$ includes said public key p_B of said second correspondent.

9. (Currently Amended) A method according to claim 1 wherein said second function including said generator $[[f\alpha]]$ $\underline{f(\alpha)}$ includes said public key p_A of said first correspondent.

10. (Original) A method according to claim 1 wherein said cryptographic functions F are hashes of δ and K .

11. (Currently Amended) A method of transporting a key between a pair of correspondents A, B to permit exchange of information therebetween, each of said correspondents having a respective private key a, b and a public p_A, p_B derived from a generator α and respective ones of said private keys a, b , said method including the steps of

i) a first of said correspondents A selecting a first random integer x and exponentiating a function $f(\alpha)$ including said generator to a power $[[g^{(x)}]]$ $\underline{g(x)}$ to provide a first exponentiated function $f(\alpha)^{g(x)}$.

ii) said first correspondent A forwarding to a second correspondent B a message including said first exponentiated function $f(\alpha)^{g(x)}$;

iii) said second correspondent B constructing a session key K from information made public by said first correspondent A and information that is private to said second correspondent B, said session key K also being constructible by said first correspondent A from information made public by B and information that is private to said first correspondent A;

iv) both of said first correspondent A and said second ~~correspondents~~ correspondent B computing a respective value h, h' of function $F[\delta, K]$ where $F[\delta, K]$ denotes a cryptographic function applied to δ and K and where δ is a subset of the public information provided by one of said correspondents;

v) at least one of said correspondents comparing said values h, h' obtained from said cryptographic function F to confirm their correspondence $[[;]]$.

12. (Original) A method of claim 11 wherein said message forwarded by said first correspondent includes an identification of the first correspondent.

13. (Original) A method according to claim 11 wherein said message forwarded by said first correspondent includes said value obtained from said cryptographic function by said first correspondent.

14. (Original) A method according to claim 11 wherein said values obtained from said cryptographic functions are obtained from a hash of said public information and said session key K.

15. (Original) A method according to claim 11 wherein said first correspondent selects a pair of random integers x and t and generates a session key K as $f(\alpha)^{g(t)}$, and generates a value r from said first exponentiated function $f(\alpha)^{g(x)}$ which includes a factor exponentiating said public key p_B of said second correspondent B with said random integer t to be of the form $p_B^{E(t)} \alpha^{g(x)}$.

16. (Original) A method according to claim 15 wherein said first correspondent A generates a value s from a combination of said random integer x and said private key a and forwards said value of r and said value of s to said second correspondent B to permit said second correspondent B to recover said session key K using the private

key b of said second correspondent B.

17. (Original) A method according to claim 16 wherein said random integer x and said private key a are combined to produce s such that $s = x - ra \bmod (p-1)$.

18. (Original) A method according to claim 17 wherein said cryptographic function F is a hash of said public information δ and said session key K .

19. (Original) A method according to claim 18 wherein said public information δ is the public key p_A of said first correspondent A.
